Process & Decision Documentation

Project/Assignment Decisions

Changed the camera so it would slightly wave up and down, added clouds to the background that move slightly slower than the camera and changed the colour scheme of the level to portray a more peaceful and dreamy experience for the player.

GenAI Documentation

GenAI was used in this assignment.

Date Used: February 21st, 2026

Tool Disclosure: Claude Sonnet 4.6

Purpose of Use: I used it to explain the side quest's prompt's meaning and provide examples of what changes could be made that would align with the assignment's request. I specified the intended emotion to be a peaceful experience. I then chose 2 of its suggestions and made it slowly break down how I could implement these changes.

Summary of Interaction: The tool first explained what the prompt meant. It then gave suggestions for different ways I could implement emotion to the example code. It then gave different code I could add directly to make changes (and explained how it worked)

Human Decision Point(s): The LLM gave me a lot of suggestions at first, but I made sure to choose what works best for my skill level and could further expand my understanding of how to use the camera feature creatively. It then gave my suggestions of what exactly to do, but I made sure to try things out for myself with minimal instruction, and then asked for tips for debugging. I then adjusted the camLerp update to align more with my taste (so it shook a bit more than the LLM suggested). I also choose all the colours myself.

Integrity & Verification Note: Instead of making the AI give me updated files of code, I individually put every new code in myself and made sure to test each new feature. That's how I found that its initial code for the camLerp to work was faulty.

Scope of GenAI Use: The GenAI did most of the work except changing the colours of the levels, and the small adjustments to its suggestions (for example, updating the initial formula it created for cam.y so it looks how I want it).

Limitations or Misfires: It took me a lot of slightly adjusting the numbers in the cam.y formula and even finding where exactly to update the colours of elements in the level to get an outcome I desired (and that actually worked).

Summary of Process (Human + Tool)

- My main problem was working with making cam.y actually shift, the AI gave me a formula using sin to create a consistent up and down wave across. I didn't fully understand it and so it did clarify, but just adding that code alone did not work and I ended up having to add "Infinity" to cam.clampToWorld (and I only learned that from asking the LLM)
- My initial colour scheme did not work, as using pastels often meant the contrast was low, so I updated the colours so each element felt distinct but still cohesive

Decision Points & Trade-offs

Describe one or two key decisions you made:

- Instead of allowing the LLM to update the code file, I made it write out all new code so I could read through it individually and determine if it 1. Makes sense to me and 2. Allows me to easily remove the code if it ends up not working. This allowed me to practice my debugging skills and so I understood every part of the code

Verification & Judgement

Explain how you evaluated whether your decision or change was appropriate:

- Kept playing it on my own until I felt that the emotion of peacefulness was being portrayed throughout the entire playing experience
